RFID transponder keys

Article No.: KY 60X

The key to digital high-security technology – the STUV RFID transponder key made of durable hard composite materials is used for tamper-proof access control.

Properties

- Passive reading of user ID
- Highly robust version
- AES encryption
- Maintenance-free
- Key numbering freely selectable
- Key colour selectable

Functional description

The transponder is increasingly replacing the mechanical key and opening up access to digital security technology. The passive reader technology does not require battery replacement, and AES encryption reliably prevents access data and user IDs from being spied on. User types and time profiles can be defined using the access management software. In addition, accesses can be logged for later documentation.
