

RFID transponder keys

Article No.: KY 60X

The key to digital high-security technology - the STUV RFID transponder key made of resistant hard composite materials is used for tamper-free access control.

Properties

- Passive reading of the user ID
- Highly robust version
- AES encryption
- Maintenance-free
- Key numbering freely selectable
- Key colour freely selectable

Functional description

The transponder is increasingly taking the place of the mechanical key and opening up access to digital security technology. The passive reader technology does not require a battery change and the AES encryption reliably prevents access data and user ID from being spied on. User types and time profiles can be defined via the access management software. In addition, access can be logged for later documentation.
