

HSL RFID long plate door fitting with integrated AES reader

Article No.: RB 110

Long backplate fittings with RFID reader are used on one or both sides, depending on the lock function. The fitting is bolted to the door using two continuous pin fittings. The result is a precise functional unit and a perfectly protected locking mechanism. In STUV fittings, the RFID reader is securely protected by a stainless steel housing.

Properties

- RFID reader on one or both sides
- Suitable for door thicknesses up to 200 mm
- For key profile P40 and P41
- Also available for fire doors in T30 and T90

Functional description

The stainless steel long backplate fitting is inserted as part of motorised locks that can be controlled via an RFID reader. As the mechanical locking mechanism is generally not used due to the motorised operation, this long backplate fitting with RFID reader offers reliable protection against tampering or soiling thanks to lockable sliders. The slider is secured with a Torx screw.
